Education

Kalinga Institute Of Industrial Technology

Bhubaneswar, OD , IN

BTech in Computer Science and System Engineering

08/2024 - 06/2028

Projects

Elin Programming Language

Python, C++, Virtual Machine

01/2026 - Present

- Designed a complete compiler toolchain (3,190 LOC) with lexer, recursive-descent parser, static type system with inference, and code generator with constant folding and peephole optimization
- Built a stack-based virtual machine in C++ (1,258 LOC) executing 43+ opcodes with call stack frames and a multi-segment bump allocator with handle-based indirection
- Implemented region-based memory management for automatic cleanup without garbage collection, plus runtime detection of use-after-free and out-of-bounds access

Rta Code Editor

Python, Go, C/Lua, JavaScript, React Native

04/2026 - Present

- Developed a 22-tool AI coding agent with custom semantic search engine, LSP integration for real-time diagnostics, and AST-aware code refactoring
- Built a multi-provider AI proxy with automatic failover across 6 providers, streaming responses, and tier-based rate limiting with per-user locks preventing race conditions
- Pioneered context compaction enabling unlimited session length beyond context window limits with tree-structured session persistence
- Shipped cross-platform ecosystem: CLI agent, desktop IDE (C/Lua), mobile app (React Native), and web dashboard (Preact)

Container Provider (TempDev)

Go, Docker, WebSockets, Cloudflared

04/2026 - 05/2026

- Engineered a multi-tenant container platform in Go provisioning isolated Linux environments in ~400ms via WebSocket-based terminal sessions with dynamic resize
- Integrated Cloudflare tunnel provisioning inside containers using HTTP2 protocol with real-time URL streaming to connected clients
- Architected a lock-free concurrent scheduler achieving 20 simultaneous containers in ~1.6s with background goroutine-based cleanup and billing
- Implemented defense-in-depth security: cgroup resource limits, no-new-privileges, non-root sessions, and iptables-based AWS metadata endpoint blocking

Microcontroller OS

C++, ESP8266, LittleFS

09/2025 - Present

- Engineered a complete embedded OS runtime on ESP8266 (80KB RAM) with interactive shell, 12 UNIX-like filesystem commands, and first-boot auto-provisioning
- Designed a custom declarative configuration system with full parser, in-memory storage, and persistent write-back — inspired by NixOS's `configuration.nix`
- Implemented a dual-output abstraction layer routing all output to Serial or OLED display with paginated text viewer and console-like scrolling

- Built a custom Version Control System CLI from scratch in Go to track and version local repository directories
- Developed an indexing engine utilizing SHA256 mapping to track delta changes, similar to Git's object database
- Created a React web dashboard connected via FastAPI to visually map commit histories and branch topologies

Skills

Programming Languages:  Go,  Python,  C++,  JavaScript,  C, Odin

Tools and Frameworks: Docker, FastAPI, React, Electron, WebSockets, Linux (PTY, cgroups), Cloudflared, LittleFS, Git

Languages: English (Proficient), Hindi (Native)
